

AI Product Manager — NovaStack AI

At GrowthX, I own product and engineering delivery end to end, from user discovery and prioritization through launch, experimentation, reliability, and analytics. The notification platform I built generated 516 opens and 447 clicks in 30 days—evidence that I care about shipped behavior, not just shipped code.

NovaStack's need for someone to own discovery through launch across an agent platform matches how I already work. I have written PRDs, shaped roadmaps and release scopes, designed workflows, partnered directly with founders, and translated ambiguous user problems into buildable systems. At Pink Unicorn Algorithms, I owned strategy and delivery across CarbonNex, Rapidero, and Risk AI Council; the workflows I designed reduced more than four hours of daily manual work and removed manual rate-lookup errors. I also led launch messaging, website structure, learning programs, and content for Risk AI Council.

The focus on workflow automation is especially relevant. At GrowthX, I built an AI operations agent that automates routine work and drafts Slack replies on a user's behalf. Separately, my open-source AI Digital Twin manages job applications, PR reviews, follow-ups, meetings, and memory around relationships and communication style. I have also built AI voice agents with real client dialogue flows and prompt architectures. That combination gives me product judgment grounded in implementation: I can define the user problem, write the spec, challenge the technical approach, ship the feature, and inspect what happens after launch.

I'd welcome a conversation about owning NovaStack's agent-platform roadmap and turning its mid-market operations problems into reliable, measurable workflows.
